Product Bill Calculator

Pseudocode and flowchart

The pseudocode below treats the product name, price, and quantity inputs as repeated for each of the n products.

Pseudocode

```
START
INPUT n
subtotal = 0

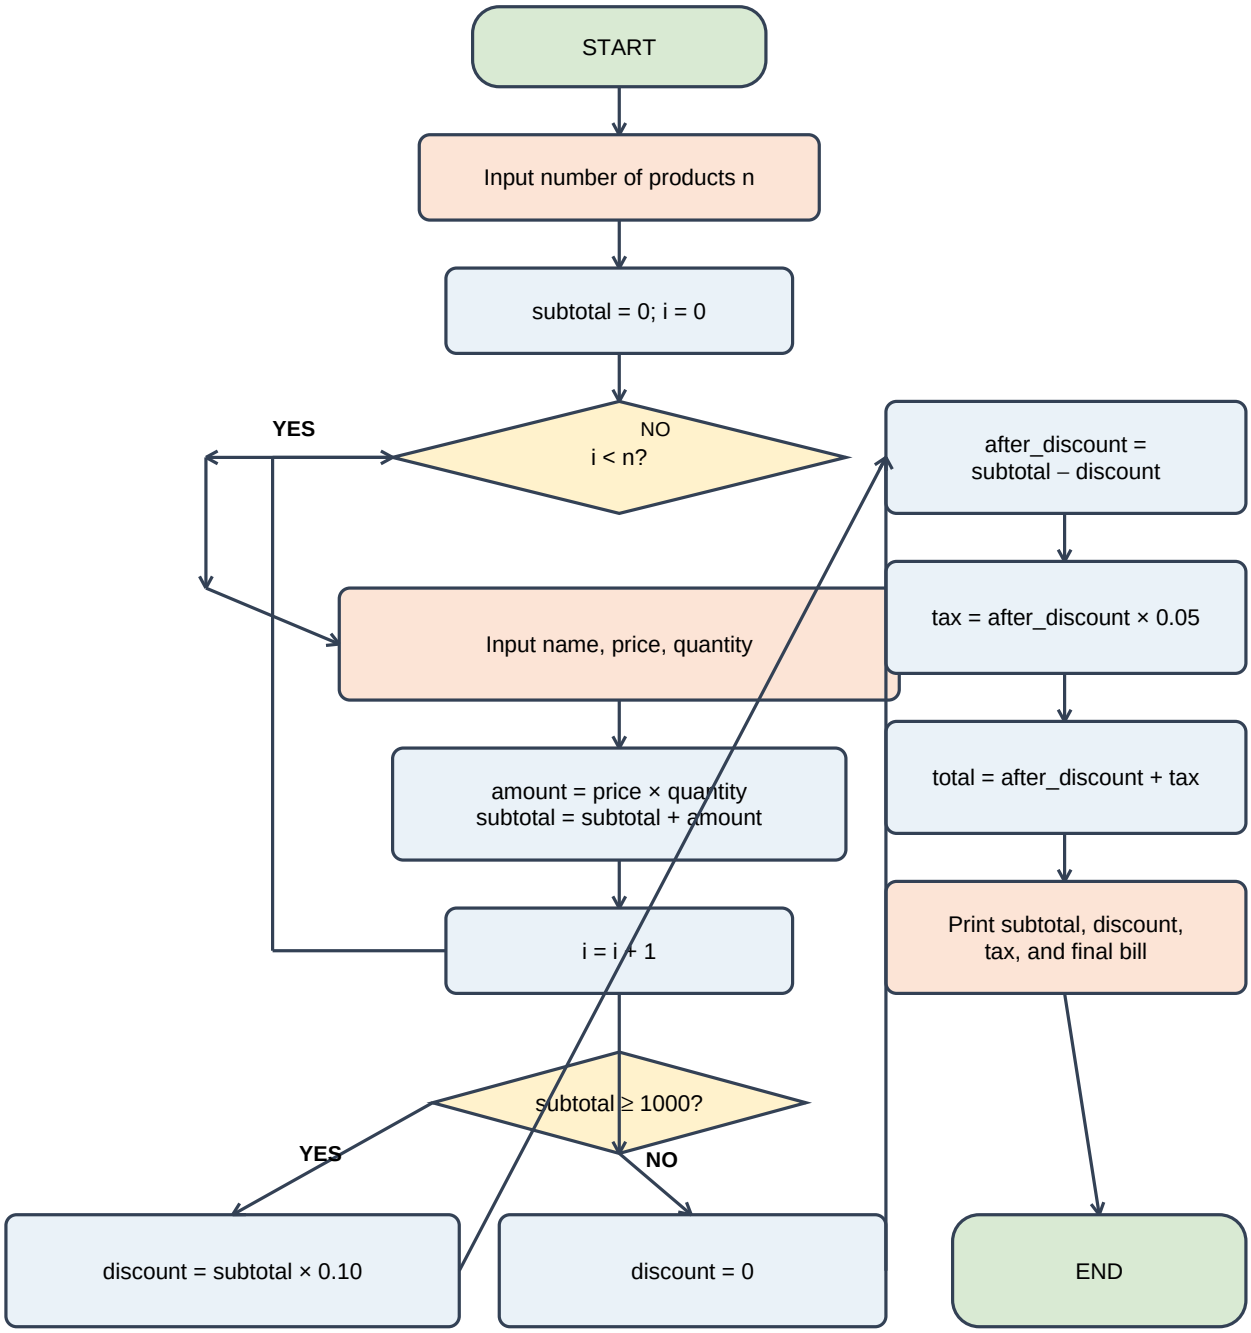
FOR i = 1 TO n
    INPUT name
    INPUT price
    INPUT quantity
    amount = price * quantity
    subtotal = subtotal + amount
    PRINT name, "amount = Rs.", amount
END FOR

IF subtotal >= 1000 THEN
    discount = subtotal * 0.10
ELSE
    discount = 0
END IF

after_discount = subtotal - discount
tax = after_discount * 0.05
total = after_discount + tax

PRINT subtotal, discount, tax, total
STOP
```

Flowchart



Flow follows the product loop, then calculates the discount and tax.
